To search Google type a word in the search box and click the Google Search Button.

If a typo is made or you don’t know how to spell a word Google will suggest alternatives. In this example the search term has been entered as *commerical* but Google correctly suggests: Did you mean: commercial. You can click on the correction to search the corrected word.

Google will find pages with misspelled words. On this example Google found 134,000 examples of the misspelled *commerical*, but doing a search on the correctly spelled term returns over 17 million hits.

Google will also correct misspelled proper names too.

When searching multiple terms you do not need to use ‘AND’.

To eliminate a term from the search you can put a minus sign in front of the term. Searching *clemency hearings children* will return pages that use the terms *clemency hearings* but which do not include the *children*.

Very common words or terms might be eliminated from the search. In the search below the *I* of *level I* is not searched.

By adding a plus sign in front of the term you force Google into searching for that term too. Doing a search on *trauma care level +I* using the plus sign has more targeted results.

Phrases can be searched by typing it within quotation marks.

“OR” can be used to broaden a search and it can be used between phrases, for example: “commercial law” OR “immigration law.” The “OR” should be uppercase.

A very useful feature of Google is the ability to limit a search by the domain. For example: the Law Library’s web address is: www.law.fsu.edu/library. Of that address www.law.fsu.edu is the domain. You can, for example, limit a Google search of the phrase “business law” to the FSU Law School domain by entering “business law” site:www.law.fsu.edu. It is very important to use the format: site:domain.

In the example above the term “terrorism” has been searched on the UN Treaty site. Notice that the first response does in fact come from the untreaty.un.org domain as do all the other responses this search will return.

Google can search foreign words that use letters that are different from those used in English. To get good results these foreign letters should be used. Doing a foreign language search on the German word uberstaatliches using a u as the first letter rather than a ü will get either no results at all or only sources that are misspelled the same way.

To insert a letter like the German u above that includes an umlaut or dieresis you should, on your computer, open Character Map. Most computers will have this installed. On my computer this is under System Tools but the location varies from computer to computer so you might have to hunt for it.
This is Character Map. When you click on the letter it will become larger. There are two ways to copy this into a search or document. You can click on Select and then click on Copy and then paste it into the search box in Google by either doing Ctrl/v or by clicking on Edit and then Paste. The other way to put the letter into the Google search box or any document is to use the Keystroke. Notice that the Keystroke for ü is Alt+0252. Remember that and go to the document where you want to enter this font. Hold down the Alt key, and using the keypad type 0252. You do not type the +. The plus sign indicates the you hold down the Alt key while you type the number. You must use the keypad and also you must type the 0. (Alt+0252 and Alt+252 are not the same.)

Note that there are many different foreign fonts that can be inserted in this way.

In this search überstaatliches returned no hits while überstaatliches returned 137. The difference being only the correct use of the German ü.

If your search returns a page in a foreign language Google also has translation tools. You can translate pages into English that are in German, French, Spanish, Italian and Portuguese. This is a machine translation and it is not a perfect translation, but usually adequate for getting a general sense of the content.

Chinese characters can also be searched.
Another useful tool is Cached pages. If you cannot get to a page, because the page has been removed or they're having technical difficulties on the site that hosts the document you can try Cached. Google keeps some old pages in Cached storage. This doesn’t always work but it does some of the time.

You can click on Similar pages which will try to match the content of the current selection and find other pages that match that content.

It's not Google, but the Wayback Machine is another good way to find content that has been removed or has become unavailable on the web. It's at: www.waybackmachine.org

Google Scholar allows you to look for Scholarly literature.

Google Scholar searches:
Author:dworkin ronald
author:dworkin "law's"

Google Book search will search the full text of some books.
Relevancy

Recall is the proportion of relevant documents retrieved by the system.

\[
\frac{A}{A+B} \times 100\%
\]

Precision is the proportion of retrieved documents that are relevant.

\[
\frac{A}{A+C} \times 100\%
\]
